Entering Averages

The purpose of an entering average is to provide handicap while the bowler is establishing an average in accordance to the league rules.

League rules should address the number of games required to establish an average. Common options for a league to adopt are:

1. Set the number of games the bowler must bowl.
2. Set the number of sessions the bowler must bowl.

Note: When using sessions to establish an average, it means the bowler establishes an average no matter how many games are bowled during each session.

Be mindful of exactly what the league is stating when it adopts either option. In extreme cases it could take a bowler six sessions to bowl six games. Similarly, a bowler may only have two games bowled in two sessions.

When considering entering average rules, the league should consider which criteria best represents the true ability of all league bowlers. And what is fairest to the league as a whole. Think about the criteria for returning bowlers and new bowlers.

Many leagues only use averages established in leagues within the association under which the league is certified. These are commonly called "book average". Using an entering average from one association, may not be a true reflection of the bowler’s ability. This is why USBC recommends leagues use highest USBC average of 21 or more games. Averages can be verified on the spot by going to the Find A Member section of the USBC website: BOWL.com. Another thing to remember, a previous season USBC average also include summer unless the league rules specifically state summer averages do not apply.

Sample entering average rule:

The league entering average shall be:

1. Last year’s average of 21 or more games in the same league for those bowlers returning, including substitutes.
2. New Bowlers. Any bowler who does not meet the entering average criteria is considered a new bowler.
   a. Last year’s highest USBC average of 21 or more games for new bowlers.
   b. If the bowler does not have a USBC average of 21 or more games from last year, the bowler will establish an average the first league session.  

   NOTE: If first league session is not referenced in the league rules, then the bowler must bowl the number of games required to establish an average in accordance with the league rules. See Rule 118c and the Commonly Asked Question below.

Enter Average Rule Options and Considerations

Number of games
The above example does use the USBC average of 21 or more games, but a league can adopt another number greater or less than 21.

New bowlers
Rather than using options a and b above the league could simply assign an entering average. The assigned average is convenient but is not a true representation of the bowler’s ability. For example, a league adopts an assigned average of 165 for all new bowlers. A new bowler establishes an average of 210 but was handicapped on 165.

Another consideration for new bowlers, especially those who have not bowled in a few years is to add additional season’s average to be considered as an entering average.
Returning bowlers

To ensure a returning bowler’s average is reflective of his/her true ability, a league may want to consider the following options when adopting the entering average rule for returning bowlers.

a. Use option 2-a in the sample above for all bowlers, highest USBC Average of 21 or more games.

b. If using the average from the same league, add unless the bowler has:
   1. A higher average 21 or more games in another USBC league from the previous season.
   2. An average of 10 pins (can change the number of pins) or more in another USBC league from the previous season.

Commonly Asked Question

Q: If the league does not use entering averages and requires three games to establish an average what happens if a bowler only bowls two games the first night.

A USBC Rule 118c states a bowler who does not have an entering average or until they meet the requirements defined in the league rules, the average is determined by dividing the total number of pins by the total number of games bowled the first night.

The bowler would establish a two-game average based on the games bowled the first night. The bowler’s handicap for the first night and the bowler’s absentee score would also be based on this two-game average.

When the bowler returns the next week his/her average and handicap for the first game would still be based on the two-game average. After the bowler completes his third game, the bowler’s average and handicap would be recalculated per the league rule. Any remaining games of the series would be based on this average.
